

Burndown Chart from the previous sprint (**Sprint 1**)

Burndown Chart of **Sprint 2**

The sprint 2 started with 6 tasks worth a total of 61 story points. Four relatively minor tasks were finished by Jun. 30, consisting of 21 story points. The other two heavier tasks were also nearly done on that date. On the night of Jun. 30, feeling we had plenty of time left, we agreed to add a new task worth 20 points (the sudden fluctuation at that time was caused by a mistake when adding the new task). Those three tasks, worth a total of 60 points, were tested together and marked finished during our final meeting on the last day of the sprint, which explains the steep dive towards the end of the sprint.

The velocity is significantly higher in sprint 2 (81 points versus 47 points in sprint 1) because we are now more familiar with Docker, React, Django and Gitflow. In the previous sprint we spent lots of time learning all those stuffs and getting ourselves familiar with all those technical details, and as a result we started quite late. In sprint 2 we are able to complete the easy tasks more quickly and to spare time for more challenging tasks like provider posts and post search.
